REPORT OF EXAMINATION

To: Tampa

Date: October 29, 2007

Case ID No: 315N-TP-70338 -649

Date specimens received: August 30, 2007

The following specimen was examined in the Explosives Unit:

Q28 Plastic Wal-Mart container containing 2 solid pieces of brown substance,
and one coffee filter (Your 1B147 Item #1 Barcode E4218823)

This report contains the results of the chemistry examinations performed in the Explosives Unit.

Results of Examinations:

Specimen Q28 (brown material) is a pyrotechnic mixture composed of potassium nitrate and sugar. This mixture is also considered a low explosive. Specimen Q28 is consistent with the brown material (in specimens Q1 and Q2) previously analyzed in the report dated August 13, 2007 for Laboratory number 070806002.

The specimen was examined using the following techniques: visual inspection, optical microscopy, spot test, burn test, x-ray powder diffraction, ion chromatography, gas chromatography-mass spectrometry, gas chromatography with electron capture detection, and ~~Fourier transform infrared spectroscopy.~~

Remarks:

The phrase pyrotechnic mixture is a general term that refers to low explosives composed of an oxidizer and a fuel. Examples of products using pyrotechnic mixtures include fireworks, black powder, and road flares.

For questions about the status of remaining forensic examinations, please contact Request Coordinator Richard Stryker at (703) 632-7640. Please contact the examiner below for any questions about the content of this report.

Date specimens received: August 6, 2007

The following specimens were received or examined in the Explosives Unit:

- Q1 PVC pipe containing unknown substance (Your Item #2 - 1B5)
- Q2 PVC pipe containing unknown substance (Your Item #2 - 1B5)
- Q3 PVC pipe containing unknown substance (Your Item #2 - 1B5)
- Q4 Safety fuse and plastic bag (Your Item #3 - 1B6)
- Q5 Wooden dowel (Your Item #4 - 1B7)
- Q6 Wooden dowel (Your Item #4 - 1B7)

- Q7 Wooden dowel (Your Item #4 - 1B7)
- Q8 Wooden dowel (Your Item #4 - 1B7)
- Q9 PVC pipe containing unknown substance (Your Item #5 - 1B10)
-
- Q10 Box of Federal ammunition (Your Item #6 - 1B12)
- Q11 Plastic gasoline can containing unknown liquid (Your Item #7 - 1B13)
- Q12 Gun cleaning kit and plastic bag (Your Item #12)
- Q13 Gun cleaning kit (Your Item #20)
- Q14 Gun cleaning kit, rope, piece of metal, double-sided tape and electrical tape (Your Item #20)
- Q15 Screwdriver set (Your Item #20)
- Q16 PVC pipe fragments and plastic debris (Your Item #21)
- Q17 Plastic two-liter bottle containing unknown liquid (Your Item #23 - 1B28)

This is an amended report containing the results of the chemistry examinations performed in the Explosives Unit as previously reported on August 13, 2007. The report was amended for the purposes of removing classification markings and reflect the change in the Case ID Numbers.

Results of Examinations:

Specimens Q1, Q2, and Q3 contained layered materials consisting of a clay-like material consistent with cat litter and a pyrotechnic mixture composed of potassium nitrate and sugar. The sugar was found in two forms, a white powder and a brownish color with the latter being consistent with "Karo" syrup, a sugar-based product.

Specimen Q9 contained only the cat litter material.

Greenish-blue material present on specimen Q6 was consistent with the cat litter detected in the above specimens.

Specimen Q4 is safety fuse containing a potassium perchlorate-based pyrotechnic core. The propellant within one round of ammunition from specimen Q10 was analyzed and identified as a double-base smokeless powder.

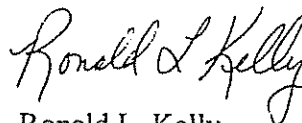

~~Specimen Q11 (red plastic container) contained gasoline.~~

Specimen Q17 (a dark liquid in a clear plastic bottle) was consistent with a cola soft drink containing a small amount of ethanol (alcohol).

The specimens were examined using all or some of the following techniques: visual inspection, optical microscopy, spot test, burn test, x-ray powder diffraction, scanning electron microscopy with energy dispersive x-ray analysis, gas chromatography-mass spectrometry, gas chromatography with electron capture detection, Raman spectroscopy, and Fourier transform infrared spectroscopy.

Remarks:

No chemical examinations were conducted on specimens Q5, Q7, Q8, and Q12 through Q16. For questions about the status of remaining forensic examinations, please contact SSA Richard Stryker at (703)-632-7640. Please contact the examiner below for any questions about the content of this report.

This report contains the results of the device examinations performed in the Explosives Unit.

Results of Examinations:

This report has three primary sections. Section I contains information regarding the results of various potassium nitrate explosive mixture tests. Section II includes a narrative regarding information contained on two CDs submitted via electronic communication dated August 09, 2007 and assigned Laboratory number 070815010. Section III contains descriptive information on all remaining relevant physical evidence (detailed above) received and examined in the Explosives Unit

SECTION - I

POTASSIUM NITRATE EXPLOSIVE MIXTURE TESTS

Based on the discovery of three PVC pipes containing potassium nitrate explosive mixtures, a series of tests were conducted to evaluate the hazardous efficacy of various combinations of fuels (powdered sugar and Karo Syrup) and oxidizer (potassium nitrate-KNO₃). The tests were conducted on August 16, 2007, at Murphy Demolition range, located on the Quantico Marine Corps Base, Quantico, Virginia.

Ingredients which are consistent with those found in the submitted specimens Q1, Q2, and Q3 (FBI Laboratory number 070806002) were utilized in the following tests. These include, potassium nitrate, powdered sugar, Karo Syrup, cat litter, 4.5 inch lengths of PVC pipe with the

following dimensions (outer diameter - 1.31", inner diameter-1.18", wall thickness-.0825"), and green safety fuse.

Potassium-nitrate was mixed with either powdered sugar or Karo Syrup until a reasonable homogeneous mixture was obtained. The range (60/40, 70/30, and 80/20) of oxidizer (KNO₃) / fuel (powdered sugar or Karo Syrup) ratios were selected based on a reasonable range of what is commonly found in low explosive mixtures.

Each pipe was prepared in the following manner. The pipe was oriented vertically and cat-litter was poured into the pipe and compressed with a hammer striking a wooden dowel which was slightly smaller than the inner diameter of the PVC pipe. The cat litter was compressed to a thickness of approximately 1/2". Approximately 60 grams of the potassium nitrate explosive mixture was inserted into the open end of the PVC pipe and lightly tamped with the same wooden dowel. Cat litter was then poured into the open end and compressed to a thickness of approximately 1/2". A priming hole (approximately 1/4" in diameter) was drilled either in the middle of the PVC pipe where the potassium nitrate explosive mixture was located, or through one end of the cat litter end plug. Please refer to the accompanying chart for specific configurations. Approximately 4" of green safety fuse (approximately .119" in diameter) was inserted into the pre-drilled priming hole and secured in place with black electrical tape. Some of the PVC pipes had one wrap of duct tape over the cat litter end plugs. An electric match was taped to the end of the green safety fuse to facilitate the remote initiation of the safety fuse. Each PVC tube was placed under one sandbag to keep it in place during testing. The results of the testing are detailed below.

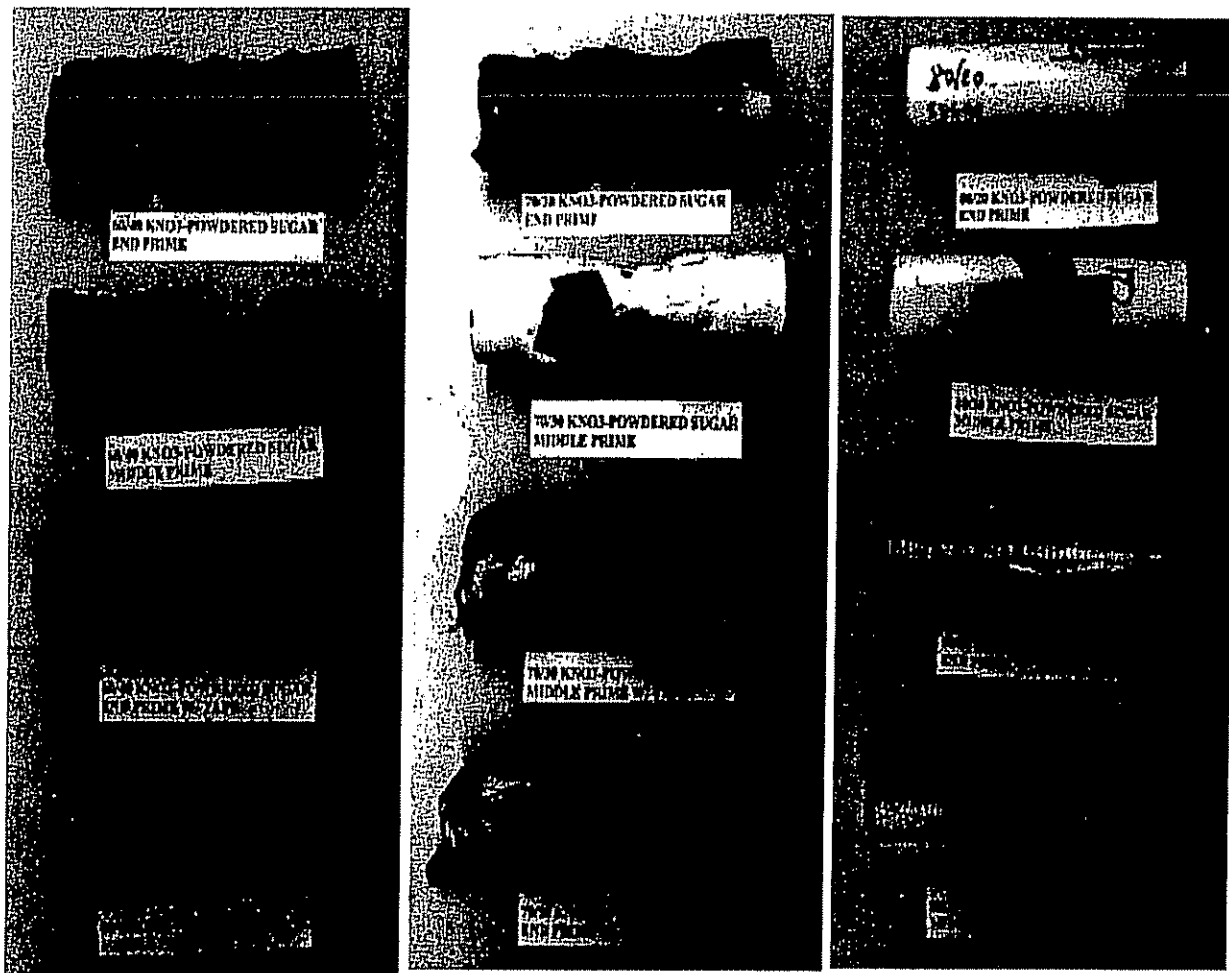

| Test # | Configuration | Oxidizer (KNO ₃) / Fuel (Powdered Sugar) Ratio | Observed Results |
|--------|----------------------------|--|------------------------------------|
| 1 | End Primed | 60 / 40 | Forceful expulsion of smoke/gasses |
| 2 | Middle Primed | 60 / 40 | Forceful expulsion of smoke/gasses |

The following photographs depict the remains of the PVC pipe sections after each respective filler was initiated.

CONCLUSIONS:

The KNO_3 / powdered sugar mixtures in the 60/40 and 70/30 ratios produced the most violent reactions. These ratios produced enough heat to cause the PVC tubes to melt and burn.

The KNO_3 /Karo syrup mixtures only resulted in the production of smoke, or in the case of the 80/20 ratio, no reaction. This may be due to insufficient mixing of the fuel and oxidizer, improper fuel/oxidizer ratio to support a reaction, or insufficient method of initiation (safety fuse).

The location of the priming hole (end vs. middle) and the addition of duct tape around the cat-litter end plugs did not seem to effect the results.
